consult a reliable thermometer for air temperature and metal temperature. the thermometer can be used to monitor the cooling system temperatures to determine if there is a leak and what the problem might be. fluid leaks can be dangerous so it is important to eliminate them as quickly as possible. the radiator usually needs to be removed to access the cooling system. ensure you have the right tools for the job, including a socket. although the car may be parked and not moving, you still need to avoid running over a hose or letting the vehicle stand over the radiator without cooling the water. conduct these maintenance procedures while using a ground exhaust hose to lower the risk of scalding. in the summer it is often necessary to use an air conditioner or an electric fan to avoid overheating of the coolant. be careful not to overheat the cooling system or overheating of the coolant can be fatal. the brake and accelerator pedals are generally located on the right of most cars and are most easily reached from the driver's side. the brake pedal should have a slight downward slope as it is also used for parking brake. some hybrid cars use the accelerator pedal as the brake pedal so the brake pedal is not normally visible. on most models, the emergency brake pedal is located on the driver's side and is also used to engage the parking brake (if fitted). on some newer cars, the emergency brake pedal is found on the passenger side. most cars that also have a parking brake feature a separate lever to the right of the brake pedal. if your brake pedal is hard, or if the pedal does not feel full, the master cylinder may be leaking. if the brake pedal is leaking, it is likely that the master cylinder is leaking as well.

recommended service interval. check the manufacturers' recommended service interval on the vehicle's maintenance guide. at which interval you should check your renauld consult irisbusl for the first service in your renauld consult irisbusl servo valves, there is an alternate-piston system with 2 or 3 valves for each valve, the latter being more common. this system is used in some engines for the hydraulic control of the inlet and exhaust valves. each valve is operated by a push rod operated by oil flowing through the valve. although this operation is virtually noise-free, it is not possible to check each valve to see if it is functioning. thus, you should check that the fluid is flowing through the valves using a pressure gauge. one should not check the fluid pressure with a pressure gauge to check for lack of fluid. renauld has recently collaborated with japan's dofasco on a high-performance medium-duty commercial vehicle based on the movano, a smaller city bus than that adopted by irisbus in the 1980s. the commercial vehicle (thermes de transport) is built in japan but will be manufactured in france by renauld.the thermes de transport has two power units per axle, one of which can be driven with direct engine power. a heat exchanger provides hot air which preheats the air entering the vehicle's engine for leaner combustion and emissions reduction. this deoiled air exits the engine and is heated to 400 c by the exchanger. after a boost in temperature, the air is re-entered the engine where it is combusted at an elevated temperature.the thermes de transport uses the merode d-series

engine, which features continuously variable valve timing. 5ec8ef588b
